

Note:
Radiative-Convective Code

Three-Dimensional Cloud-Permitting Nonhydrostatic models run into statistical equilibrium with calculated or prescribed radiative cooling over a fixed, constant sea surface temperature (Doubly-periodic domains)

Robe and Emanuel, J. Atmos. Sci., 1996

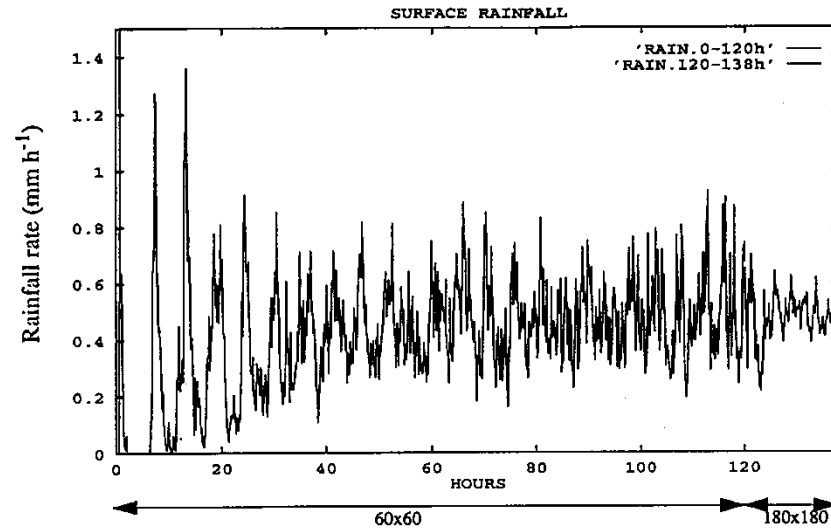

Figure 4.5: time-series of the horizontally averaged rainfall at the ground for $R = -5.4$ K/day. The domain extends over $60 \times 60 \text{ km}^2$ for the first 120 hours, and over $180 \times 180 \text{ km}^2$ for the last 18 hours.

Simple Radiative-Convective Model

Enforce convective neutrality:

$$T_1 = T_2 + \Delta T,$$

$$T_s = T_2 + 2\Delta T$$

$$TOA: T_2 = T_e \rightarrow T_1 = T_e + \Delta T, \quad T_s = T_e + 2\Delta T$$

$$Surface: F_s + \sigma T_s^4 = \sigma T_e^4 + \sigma T_1^4$$

$$Layer 2: 2\sigma T_e^4 = \sigma T_1^4 + F_c$$

$$Define \quad x \equiv \frac{\Delta T}{T_e},$$

$$F_s = \sigma T_e^4 \left[1 + (1+x)^4 - (1+2x)^4 \right],$$

$$F_c = \sigma T_e^4 \left[2 - (1+x)^4 \right]$$

Manabe and Strickler 1964 calculation:

Flux of water by convection makes real problem complex
