## VOLUME 1 - 3RD EDITION

p. vi (-16) Change title of Chapter 6 to "Approximate Dynamic Programming"
p. $7(+19)$ Change "... after operation B ..." to "... after operation C ..."
p. $52(+5)$ Change " $J_{0}(1)=2.67$ and $J_{0}(2)=2.608$ " to " $J_{0}(1)=2.7$ and $J_{0}(2)=2.818^{\prime \prime}$
p. $99(+1)$ Change "Figure 2.4.1" to "Figure 2.4.2"
p. 106 (-15) Add footnote: "Our definition of piecewise continuous control functions assumes a finite number of points of discontinuity within $[0, T]$. The solution $x(t)$ of the differential system (3.1) is then continuous for $t \in[0, T]$, and differentiable at all points $t \in[0, T]$ where $u(t)$ is continuous. Thus, formally, for given piecewise continuous $u(t)$, a solution of Eq. (3.1) is a continuous function $x(t)$ which is differentiable at all points of continuity of $u(t)$ and satisfies Eq. (3.1) at these points."
p. 171 (-3) Change " $e^{-x / a "}$ to " $-e^{-x / a "}$
p. 172 (-8) Change "Using relation (4.31)," to"Using relations (4.30) and (4.31),"
p. $213(+9)$ This problem is flawed as stated. Replace the statement with the following:

### 4.27

Consider the quiz contest problem of Example 5.1, where the questions are partitioned in $M$ groups, and there is an order constraint that all the questions in group $m$ must be answered before the questions in group $m+1$ can be answered. Show that an optimal list can be constructed by ordering the questions within each group in decreasing order of $p_{i} R_{i} /\left(1-p_{i}\right)$. Consider also the problem of optimally ordering the groups in addition to optimally ordering the questions within each group. Show that it is optimal to answer groups in order of decreasing $W /(1-P)$, where for a given group, $W$ is the expected reward obtained by answering only the questions of that group and in optimal order, and $P$ is the probability of answering all the questions of the group correctly.

to

$$
J_{N-1}(x)=\min \left[G_{N-1}(x), \min _{y>x}\left[K+G_{N-1}(y)\right]\right]-c x .
$$

p. 168 The following is a cleaner version of the three paragraphs starting with the title "Asset Selling":

## Asset Selling

As a first example, consider a person having an asset (say a piece of land) for which he is offered an amount of money from period to period. We assume that the offers, denoted $w_{0}, w_{1}, \ldots, w_{N-1}$, are random and independent, and take values within some bounded interval of noonnegative numbers ( $w_{k}=0$ could correspond to no offer received during the period). If the person accepts an offer, he can invest the money at a fixed rate of interest $r>0$, and if he rejects the offer, he waits until the next period to consider the next offer. Offers rejected are not renewed, and we assume that the last offer $w_{N-1}$ must be accepted if every prior offer has been rejected. The objective is to find a policy for accepting and rejecting offers that maximizes the revenue of the person at the $N$ th period.

The DP algorithm for this problem can be derived by elementary reasoning. As a modeling exercise, however, we will embed the problem in the framework of the basic problem by specifying the system and cost. We define the state space to be the real line, augmented with an additional state (call it $T$ ), which is a termination state. By writing that the system is at state $x_{k}=T$ at some time $k \leq N-1$, we mean that the asset has already been sold. By writing that the system is at a state $x_{k} \neq T$ at some time $k \leq N-1$, we mean that the asset has not been sold as yet and the offer under consideration is equal to $x_{k}$ (and also equal to the $k$ th offer $w_{k-1}$ ). We take $x_{0}=0$ (a fictitious "null" offer). The control space consists of two elements $u^{1}$ and $u^{2}$, corresponding to the decisions "sell" and "do not sell," respectively. We view $w_{k}$ as the disturbance at time $k$.

With these conventions, we may write a system equation of the form

$$
x_{k+1}=f_{k}\left(x_{k}, u_{k}, w_{k}\right), \quad k=0,1, \ldots, N-1
$$

where the function $f_{k}$ is defined via the relation

$$
x_{k+1}= \begin{cases}T & \text { if } x_{k}=T, \text { or if } x_{k} \neq T \text { and } u_{k}=u^{1}(\text { sell }) \\ w_{k} & \text { otherwise }\end{cases}
$$

Note that a sell decision at time $k\left(u_{k}=u^{1}\right)$ accepts the offer $w_{k-1}$, and that no explicit sell decision is required to accept the last offer $w_{N-1}$, as it must be accepted by assumption if the asset has not yet been sold. The corresponding reward function may be written as

$$
\underset{\substack{w_{k} \\ k=0,1, \ldots, N-1}}{E}\left\{g_{N}\left(x_{N}\right)+\sum_{k=0}^{N-1} g_{k}\left(x_{k}, u_{k}, w_{k}\right)\right\}
$$

where

$$
\begin{gathered}
g_{N}\left(x_{N}\right)= \begin{cases}x_{N} & \text { if } x_{N} \neq T \\
0 & \text { otherwise }\end{cases} \\
g_{k}\left(x_{k}, u_{k}, w_{k}\right)= \begin{cases}(1+r)^{N-k} x_{k} & \text { if } x_{k} \neq T \text { and } u_{k}=u^{1}(\text { sell }) \\
0 & \text { otherwise }\end{cases}
\end{gathered}
$$

\frac{P\left(x_{1}=\bar{P}, G, G \mid C\right)}{P(G, G \mid C)}
$$

p. 222 (-9) Change $\left.x_{N-1}^{\prime} K_{N-1} x_{N-1} \mid I_{N-2}\right\}$ to $E\left\{x_{N-1}^{\prime} K_{N-1} x_{N-1} \mid\right.$ $\left.I_{N-2}, u_{N-2}\right\}$
p. $244(+9)$ The following is a cleaner version of the three pages that start with "The Conditional State Distribution as a Sufficient Statistic" title and end just before the "The Conditional State Distribution Recursion" title.

## The Conditional State Distribution as a Sufficient Statistic

There are many different functions that can serve as sufficient statistics. The identity function $S_{k}\left(I_{k}\right)=I_{k}$ is certainly one of them. To obtain another important sufficient statistic, we assume that the probability distribution of the observation disturbance $v_{k+1}$ depends explicitly only on the immediately preceding state, control, and system disturbance $x_{k}, u_{k}, w_{k}$, and not on $x_{k-1}, \ldots, x_{0}, u_{k-1}, \ldots, u_{0}, w_{k-1} \ldots, w_{0}, v_{k-1}, \ldots, v_{0}$. Under this assumption, it turns out that a sufficient statistic is given by the conditional probability distribution $P_{x_{k} \mid I_{k}}$ of the state $x_{k}$, given the information vector $I_{k}$. In particular, we will show that for all $k$ and $I_{k}$, we have

$$
\begin{equation*}
J_{k}\left(I_{k}\right)=\min _{u_{k} \in U_{k}} H_{k}\left(P_{x_{k} \mid I_{k}}, u_{k}\right)=\bar{J}_{k}\left(P_{x_{k} \mid I_{k}}\right), \tag{5.34}
\end{equation*}
$$

where $H_{k}$ and $\bar{J}_{k}$ are appropriate functions.
To this end, we note an important fact that relates to state estimation of discrete-time stochastic systems: the conditional distribution $P_{x_{k} \mid I_{k}}$ can be generated recursively. In particular, it turns out that we can write for all $k$

$$
P_{x_{k+1} \mid I_{k+1}}=\Phi_{k}\left(P_{x_{k} \mid I_{k}}, u_{k}, z_{k+1}\right),
$$

where $\Phi_{k}$ is some function that can be determined from the data of the problem. Let us postpone a justification of this for the moment, and accept it for the purpose of the following discussion.

We note that to perform the minimization in Eq. (5.32), it is sufficient to know the distribution $P_{x_{N-1} \mid I_{N-1}}$ together with the distribution $P_{w_{N-1} \mid x_{N-1}, u_{N-1}}$, which is part of the problem data. Thus, the minimization in the right-hand side of Eq. (5.32) is of the form

$$
J_{N-1}\left(I_{N-1}\right)=\min _{u_{N-1} \in U_{N-1}} H_{N-1}\left(P_{x_{N-1} \mid I_{N-1}}, u_{N-1}\right)=\bar{J}_{N-1}\left(P_{x_{N-1} \mid I_{N-1}}\right)
$$

for appropriate functions $H_{N-1}$ and $\bar{J}_{N-1}$.
We now use induction, i.e., we assume that

$$
J_{k+1}\left(I_{k+1}\right)=\min _{u_{k+1} \in U_{k+1}} H_{k+1}\left(P_{x_{k+1} \mid I_{k+1}}, u_{k+1}\right)=\bar{J}_{k+1}\left(P_{x_{k+1} \mid I_{k+1}}\right),
$$

for appropriate functions $H_{k+1}$ and $\bar{J}_{k+1}$, and we show that

$$
J_{k}\left(I_{k}\right)=\min _{u_{k} \in U_{k}} H_{k}\left(P_{x_{k} \mid I_{k}}, u_{k}\right)=\bar{J}_{k}\left(P_{x_{k} \mid I_{k}}\right)
$$

or appropriate functions $H_{k}$ and $\bar{J}_{k}$.
Indeed, for a given $I_{k}$, the expression

$$
\min _{u_{k} \in U_{k} x_{k}, w_{k}, z_{k+1}}^{E}\left\{g_{k}\left(x_{k}, u_{k}, w_{k}\right)+J_{k+1}\left(I_{k+1}\right) \mid I_{k}, u_{k}\right\}
$$

in the DP equation (5.33) is written as

$$
\min _{u_{k} \in U_{k} x_{k}, w_{k}, z_{k+1}}^{E}\left\{g_{k}\left(x_{k}, u_{k}, w_{k}\right)+J_{k+1}\left(\Phi_{k}\left(P_{x_{k} \mid I_{k}}, u_{k}, z_{k+1}\right)\right) \mid I_{k}, u_{k}\right\} .
$$

In order to calculate the expression being minimized over $u_{k}$ above, aside from $P_{x_{k} \mid I_{k}}$, we need the joint distribution

$$
P\left(x_{k}, w_{k}, z_{k+1} \mid I_{k}, u_{k}\right)
$$

or, equivalently,

$$
P\left(x_{k}, w_{k}, h_{k+1}\left(f_{k}\left(x_{k}, u_{k}, w_{k}\right), u_{k}, v_{k+1}\right) \mid I_{k}, u_{k}\right)
$$

By using Bayes' rule, this distribution can be expressed in terms of $P_{x_{k} \mid I_{k}}$, the given distributions

$$
P\left(w_{k} \mid x_{k}, u_{k}\right), \quad P\left(v_{k+1} \mid f_{k}\left(x_{k}, u_{k}, w_{k}\right), u_{k}, w_{k}\right)
$$

and the system equation $x_{k+1}=f_{k}\left(x_{k}, u_{k}, w_{k}\right)$. Therefore the expression minimized over $u_{k}$ can be written as a function of $P_{x_{k} \mid I_{k}}$ and $u_{k}$, and the DP equation (5.33) can be written as

$$
J_{k}\left(I_{k}\right)=\min _{u_{k} \in U_{k}} H_{k}\left(P_{x_{k} \mid I_{k}}, u_{k}\right)
$$

for a suitable function $H_{k}$. Thus the induction is complete and it follows that the distribution $P_{x_{k} \mid I_{k}}$ is a sufficient statistic.

Note that if the conditional distribution $P_{x_{k} \mid I_{k}}$ is uniquely determined by another expression $S_{k}\left(I_{k}\right)$, that is, $P_{x_{k} \mid I_{k}}=G_{k}\left(S_{k}\left(I_{k}\right)\right)$ for an appropriate function $G_{k}$, then $S_{k}\left(I_{k}\right)$ is also a sufficient statistic. Thus, for example, if we can show that $P_{x_{k} \mid I_{k}}$ is a Gaussian distribution, then the mean and the covariance matrix corresponding to $P_{x_{k} \mid I_{k}}$ form a sufficient statistic.

Regardless of its computational value, the representation of the optimal policy as a sequence of functions of the conditional probability distribution $P_{x_{k} \mid I_{k}}$,

$$
\mu_{k}\left(I_{k}\right)=\bar{\mu}_{k}\left(P_{x_{k} \mid I_{k}}\right), \quad k=0,1, \ldots, N-1
$$

is conceptually very useful. It provides a decomposition of the optimal controller in two parts:
(a) An estimator, which uses at time $k$ the measurement $z_{k}$ and the control $u_{k-1}$ to generate the probability distribution $P_{x_{k} \mid I_{k}}$.
(b) An actuator, which generates a control input to the system as a function of the probability distribution $P_{x_{k} \mid I_{k}}$ (Fig. 5.4.1).
This interpretation has formed the basis for various suboptimal control schemes that separate the controller a priori into an estimator and an actuator and attempt to design each part in a manner that seems "reasonable." Schemes of this type will be discussed in Chapter 6.

Figure 5.4.1 Conceptual separation of the optimal controller into an estimator and an actuator.

## Alternative Perfect State Information Reduction

By using the sufficient statistic $P_{x_{k} \mid I_{k}}$ we can write the DP algorithm in
an alternative form. Using Eq. (5.34), we have for $k<N-1$

$$
\begin{align*}
\bar{J}_{k}\left(P_{x_{k} \mid I_{k}}\right)=\min _{u_{k} \in U_{k}}\left[\underset{x_{k}, w_{k}, z_{k+1}}{E}\{ \right. & g_{k}\left(x_{k}, u_{k}, w_{k}\right) \\
& \left.\left.+\bar{J}_{k+1}\left(\Phi_{k}\left(P_{x_{k} \mid I_{k}}, u_{k}, z_{k+1}\right)\right) \mid I_{k}, u_{k}\right\}\right] \tag{5.35}
\end{align*}
$$

In the case where $k=N-1$, we have

$$
\begin{align*}
& \bar{J}_{N-1}\left(P_{x_{N-1} \mid I_{N-1}}\right) \\
&= \min _{u_{N-1} \in U_{N-1}}
\end{align*} \quad \underset{x_{N-1}, w_{N-1}}{E}\left\{g_{N}\left(f_{N-1}\left(x_{N-1}, u_{N-1}, w_{N-1}\right)\right) .\right.
$$

This DP algorithm yields the optimal cost as

$$
J^{*}=\underset{z_{0}}{E}\left\{\bar{J}_{0}\left(P_{x_{0} \mid z_{0}}\right)\right\}
$$

where $\bar{J}_{0}$ is obtained by the last step, and the probability distribution of $z_{0}$ is obtained from the measurement equation $z_{0}=h_{0}\left(x_{0}, v_{0}\right)$ and the statistics of $x_{0}$ and $v_{0}$.

By observing the form of Eq. (5.35), we note that it has the standard DP structure, except that $P_{x_{k} \mid I_{k}}$ plays the role of the "state." Indeed the role of the "system" is played by the recursive estimator of $P_{x_{k} \mid I_{k}}$,

$$
P_{x_{k+1} \mid I_{k+1}}=\Phi_{k}\left(P_{x_{k} \mid I_{k}}, u_{k}, z_{k+1}\right),
$$

and this system fits the framework of the basic problem (the role of control is played by $u_{k}$ and the role of the disturbance is played by $z_{k+1}$ ). Furthermore, the controller can calculate (at least in principle) the state $P_{x_{k} \mid I_{k}}$ of this system at time $k$, so perfect state information prevails. Thus the alternate DP algorithm (5.34)-(5.35) may be viewed as the DP algorithm of the perfect state information problem that involves the above system, whose state is $P_{x_{k} \mid I_{k}}$, and an appropriately reformulated cost function. In the absence of perfect knowledge of the state, the controller can be viewed as controlling the "probabilistic state" $P_{x_{k} \mid I_{k}}$ so as to minimize the expected cost-to-go conditioned on the information $I_{k}$ available.
p. 254 (-1) Change $a_{k}$ to $\alpha_{k}$
p. $255(+6)$ Change $1-\frac{1}{C}$ to $1-\frac{I}{C}$
p. $261(+8)$ Change "Exercise 5.6" to "Exercise 5.3"
p. $262(+15)$ Change $y_{0}^{\prime} K_{k} y_{0}$ to $y_{0}^{\prime} K_{0} y_{0}$
p. 266 (-5) Delete part (e) (it is correct only for open-loop policies)
p. 310 (11) Change "... tentative backed-up score $T B S(n)$ of position $n$ to $\infty$ if it is White's turn to move at $n$ and to $-\infty$ if it is Black's turn ..." to "...tentative backed-up score $T B S(n)$ of position $n$ to $-\infty$ if it is White's turn to move at $n$ and to $\infty$ if it is Black's turn ..."
p. 316 ( $+\mathbf{1 6 )}$ Change "of question" to "of questions"
p. $349(+15)$ Change "Section 1.3 " to "Section 2.3 "
p. $353(+12)$ Change "CEC is $1 . "$ to "CEC with nominal values $\bar{w}_{0}=$ $\bar{w}_{1}=0$ is 1 ."
p. $357(+13)$ Replace Exercise 6.13 by the following:

### 6.13 (Discretization of Convex Problems)

Consider a problem with state space $S$, for all $k$, where $S$ is a convex subset of $\Re^{n}$. Suppose that $\hat{S}=\left\{y_{1}, \ldots, y_{M}\right\}$ is a finite subset of $S$ such that $S$ is the convex hull of $\hat{S}$, and consider a one-step lookahead policy based on approximated cost-to-go functions $\tilde{J}_{0}, \tilde{J}_{1}, \ldots, \tilde{J}_{N}$ defined as follows:

$$
\tilde{J}_{N}(x)=g_{N}(x), \quad \forall x \in S
$$

and for $k=1, \ldots, N-1$,

$$
\tilde{J}_{k}(x)=\min \left\{\sum_{i=1}^{M} \lambda_{i} \hat{J}_{k}\left(y_{i}\right) \mid \sum_{i=1}^{M} \lambda_{i} y_{i}=x, \sum_{i=1}^{M} \lambda_{i}=1, \lambda_{i} \geq 0, i=1, \ldots, M\right\}
$$

where $\hat{J}_{k}(x)$ is defined by

$$
\hat{J}_{k}(x)=\min _{u \in U_{k}(x)} E\left\{g_{k}\left(x, u, w_{k}\right)+\tilde{J}_{k+1}\left(f_{k}\left(x, u, w_{k}\right)\right)\right\}, \quad \forall i=1, \ldots, M
$$

Thus $\tilde{J}_{k}$ is obtained from $\tilde{J}_{k+1}$ as a "grid-based" convex piecewise linear approximation to $\hat{J}_{k}$ based on the $M$ values

$$
\hat{J}_{k}\left(y_{1}\right), \ldots, \hat{J}_{k}\left(y_{M}\right)
$$

Assume that the cost functions $g_{k}$ and the system functions $f_{k}$ are such that the function $\hat{J}_{k}$ is real-valued and convex over $S$ whenever $\tilde{J}_{k+1}$ is real-valued and convex over $S$. Show that the cost-to-go functions $\bar{J}_{k}\left(x_{k}\right)$ corresponding to the one-step lookahead policy satisfies for all $x \in S$

$$
\bar{J}_{k}(x) \leq \hat{J}_{k}(x) \leq \tilde{J}_{k}(x), \quad k=0,1, \ldots, N-1
$$

Hint: Use Prop. 6.3.1.
p. 373 (-1) Replace $N_{*}(j)$ by $N^{*}(j)$
p. $374(+3),(+8)$ Replace $N_{*}(j)$ by $N^{*}(j)$
p. $396(+6)$ The expression should read

$$
\bar{\tau}_{i}(u)=\sum_{j=1}^{n} \int_{0}^{\infty} \tau d Q_{i j}(\tau, u)
$$

p. $402(+15),(+19),(-5)$ Change $g(i, u)$ to $G(i, u)$
p. 402 (-5) After Eq. (7.54), add the following sentence: If there is an "instantaneous" one-stage cost $\hat{g}(i, u)$, the term $G(i, u)$ should be replaced by $\hat{g}(i, u)+G(i, u)$ in this equation.
p. $408(+2)$ Change (7.6) to (7.17)
p. $451(+12)$ Change $C_{k} N_{k}^{-1}$ to $C_{k}^{\prime} N_{k}^{-1}$
p. 476 (-11) Change

$$
P_{d_{1}} \preceq P_{d_{2}} \text { if and only if } E\left\{U\left(f\left(d_{1}, n\right)\right) \mid d_{1}\right\} \leq\left\{U\left(f\left(d_{2}, n\right)\right) \mid d_{2}\right\} .
$$

to

$$
P_{d_{1}} \preceq P_{d_{2}} \text { if and only if } E\left\{U\left(f\left(d_{1}, n\right)\right) \mid d_{1}\right\} \leq E\left\{U\left(f\left(d_{2}, n\right)\right) \mid d_{2}\right\}
$$

## VOLUME 2-2ND EDITION

p. $7(+19)$ Change "operation $D$ can be performed only after operation $B$ has been performed" to "operation D can be performed only after operation C has been performed"
p. $50(+17)$ Change "Tsitsiklis" to "Castanon"
p. $64(+13)$ Change the first four lines of the proof as follows:

Proof: In view of Eqs. (1.59) and (1.65), existence of a PPR policy is equivalent to having, for all $i$,

$$
\begin{gather*}
\max \left\{M, \max _{j \neq i} L^{j}(x, M, J)\right\} \geq L^{i}(x, M, J), \quad \text { for all } x \text { with } x^{i} \in S^{i}  \tag{1.66}\\
M \leq L^{i}(x, M, J), \quad \text { for all } x \text { with } x^{i} \notin S^{i} \tag{1.67}
\end{gather*}
$$

p. $70(+10)$ Change $p_{i}$ to $P_{i}$
p. $74(+\mathbf{1})$ Change "..., [VeP84], and Verd'u and Poor [VeP87]." to "... , and Verd'u and Poor [VeP84], [VeP87]."
p. $\mathbf{8 0}(+\mathbf{1 7},+\mathbf{1 9}, \mathbf{2 7})$ Change 1 to $s$
p. $84(+10)$ Change the equation to

$$
\begin{equation*}
T_{\bar{\mu}} J=T J \tag{1.87}
\end{equation*}
$$

p. 94 (-1) Change equation to

$$
J_{\mu}(1)=-\left(1-u^{2}\right) u+\left(1-u^{2}\right) J_{\mu}(1)
$$

p. $95(+2)$ Change equation to

$$
J_{\mu}(1)=-\frac{1-u^{2}}{u} .
$$

p. $123(+6)$ Change "thrtwe" to (2.33)
p. $136(+3)$ Change "an optimal proper policy" to "a proper policy"
p. $136(+11)$ Change "optimal and proper." to "optimal."
p. 136 (-10) Change the last four lines of the hint to:

By taking limit superior as $N \rightarrow \infty$, we obtain $J^{*} \geq T J^{*} \geq J_{\mu}$. Therefore, $\mu$ is an optimal policy and we have $J^{*}=T J^{*}$. For the rest of the proof follow the line of proof of Prop. 2.1.2.
p. 181 (-2) Change "discount factor" to "discount factor with $\alpha<2$ "
p. 190 (-1) Change "no optimal policy (stationary or not)." to "no optimal stationary policy."
p. 206 (-1) Change " $N_{1}$ " to " $N-1$ "
p. 208 (-12) Change Exercise number to 4.32 .
p. $234(+20)$ Change "Prop. 4.3.3" to "Prop. 4.2.6"
p. $235(+14)$ Change "the probabilities $q(i, u), u \in U(i)$." to "some probabilities."
p. 247 (-4) Change "for some $\beta>0$ " to "for some $\beta \in(0,1)$ "
p. 264 (-6) Change $a_{k}$ to $\alpha_{k}$
p. $265(+3)$ Change $1-\frac{1}{C}$ to $1-\frac{I}{C}$
