DA 5. Risk Aversion

George E. Apostolakis
Massachusetts Institute of Technology

Spring 2007

## Calibration of utility functions

- We can apply a positive linear transformation to a utility function and get an equivalent utility function.

$$
\boldsymbol{\pi}(\mathbf{x})=\mathbf{a} \mathbf{U}(\mathbf{x})+\mathbf{b} \quad \mathbf{a}>\mathbf{0}
$$

- A calibrated utility function is such that

$$
\pi\left(\mathrm{C}_{*}\right)=0 \quad \text { and } \pi\left(\mathrm{C}^{*}\right)=1
$$

## Example

- Suppose that it has been determined that

$$
U(x)=\ln (x+5) \quad \text { for } \quad-4.5 \leq x \leq 4.5 \text { (in \$ million) }
$$

- Let $C^{*}=2$ and $C_{*}=-2$
- Let $\pi(x)=a \ln (x+5)+b$. Then,
$1=a \ln (7)+b \quad$ and $\quad 0=a \ln (3)+b$ to obtain $a=1.18$ and $b=-1.29$

## The Buying Price for a Lottery

- It is the purchase price at which the DM is indifferent between the alternatives of buying the lottery and not buying it.
- Let $\pi(x)$ the DM's utility function with $\pi(0)$ the utility of his present assets, i.e., before he buys the lottery.

## Example

- $\pi(x)=1.18 \ln (x+5)-1.29 \Rightarrow \pi(0)=0.61$
- $\mathbf{L}(\mathbf{1}, \mathbf{0}, \mathbf{0 . 5}, \mathbf{0 . 5})$
- $0.5 \pi(1-B P)+0.5 \pi(0-B P)=0.61$ $\Rightarrow$
- $\mathbf{1 . 1 8} \ln (\mathbf{6}-\mathrm{BP})-\mathbf{1 . 2 9}+\mathbf{1 . 1 8} \ln (5-\mathrm{BP})-1.29=1.22$
- $\ln (6-B P)+\ln (5-B P)=3.22$
$\Rightarrow$

## Example (cont'd)

- $\ln [(6-\mathrm{BP})(5-\mathrm{BP})]=3.22$
- $(B P)^{2}-11(B P)+30=\exp (3.22)=\mathbf{2 5 . 0 4}$
- $(B P)^{2}-11(B P)+4.96=0$
- $\mathbf{B P}=\mathbf{0 . 4 7}$ (the other root is $\mathbf{1 0 . 5 3}$ and is rejected)
- $\mathbf{E M V}=\mathbf{1 x 0 . 5}+\mathbf{0 x} 0.5=0.5>0.47 \Rightarrow$ risk aversion

## The Selling Price of a Lottery

- $\mathrm{SP}=\mathrm{CE} \quad$ (certainty equivalent)
- We now interpret $x=0$ to represent the DM's total assets except of the lottery.
- Utility of present wealth (situation) is $\boldsymbol{\pi}(\mathrm{L})$.
- $\pi(x)=1.18 \ln (x+5)-1.29 \Rightarrow \pi(0)=0.6091$

## Example

- $\pi(\mathbf{x})=1.18 \ln (\mathbf{x}+5)-1.29 \quad \Rightarrow \quad \pi(0)=0.6091$
- $\mathrm{L}(\mathbf{1}, \mathbf{0} \boldsymbol{0} \mathbf{0 . 5}, \mathbf{0 . 5})$
- $\pi(\mathrm{L})=0.5 \pi(1)+0.5 \pi(0)=0.5 \times 0.8243+0.5 \times 0.6091 \Rightarrow$
- $\pi(\mathrm{L})=0.7167=\pi(\mathrm{CE}) \quad \Rightarrow \quad$ Using the figure on p .4 we get
- $\mathbf{C E} \cong 0.4771<\mathrm{EMV}=0.5$

## Risk Aversion

- The DM is always willing to sell any lottery for less than its expected monetary value.
- $\mathbf{L}\left(\mathbf{x}_{1}, \mathbf{x}_{2} ; \mathbf{p}_{1}, \mathbf{p}_{2}\right)$

$$
\mathbf{E M V}=p_{1} \mathbf{x}_{1}+p_{2} \mathbf{x}_{2}
$$

- $\left.\mathbf{U}\left(\mathrm{p}_{1} \mathrm{x}_{1}+\mathrm{p}_{2} \mathrm{x}_{2}\right)=\mathbf{U ( E M V}\right)>\mathrm{p}_{1} \mathbf{U}\left(\mathrm{x}_{1}\right)+\mathrm{p}_{2} \mathbf{U}\left(\mathrm{x}_{2}\right)$
- A DM with a concave utility for money will refuse a monetarily fair bet and is said to be risk averse.

## Example

- $\mathbf{L}(1,0 ; 0.5,0.5)$
- $\mathbf{E M V}=\$ 0.5 \mathrm{M} \quad \Rightarrow \quad \pi(0.5)=0.6091$
- $0.5 \pi(1)+0.5 \pi(0)=0.7167 \Rightarrow S P=\$ 0.4771$
- Risk Premium $\equiv$ EMV - CE $=0.5-0.4771 \Rightarrow$
- $\mathbf{R P}=\mathbf{\$ 0 . 0 2 2 9} \mathbf{M}$

## Risk Aversion and Insurance

- You own a house worth $\$ \mathbf{5 0 0 , 0 0 0}$.
- A fire ( $\mathrm{p}=10^{-\mathbf{2}}$ per year) may destroy it completely.
- Your utility function is
- $\pi(x)=1.18 \ln (x+5)-1.29 ; \quad C^{*}=\$ 2 M, C_{*}=-\$ 2 M$
- How much premium would you be willing to pay? <br> \title{
Decision Tree
} <br> \title{
Decision Tree
}

## Utilities

- $\pi(\mathrm{I})=\pi(-\mathrm{x}) \quad \pi(\mathrm{NI})=\mathrm{p} \pi(-0.5)+(1-\mathrm{p}) \pi(0.0)$
- $\pi(-0.5)=1.18 \ln (4.5)-1.29=0.4848$
- $\boldsymbol{\pi}(\mathbf{0 . 0})=\mathbf{0 . 6 0 9 1}$
- $\pi(\mathrm{NI})=0.4848 \times 10^{-2}+\left(1-10^{-2}\right) \times 0.6091=$ 0.6078
- $\pi(-x)=0.6078 \Rightarrow \mathrm{x}=\mathbf{5}, 661$

## Your Perspective

- You are willing to pay up to $\mathbf{\$ 5 , 6 6 1}$ to insure your house.
- The expected loss is
$10^{-2} \times \$ 500,000=\$ 5,000<\$ 5,661 \Rightarrow$

You are willing to pay more than the expected loss because you are risk averse.

## The Company's Perspective

- Why would the insurance company agree to insure you?
- The company may win $\$ 5,661$ with probability 0.99 or lose $\$ 494,339$ with probability $\mathbf{1 0}^{\mathbf{2}}$.

## The Company's Decision Tree

Illition

## The Company's Perspective (2)

- The company has $\$ 1$ billion dollars in assets. Its wealth is either $\$ 999,505,661$ with probability $10^{-2}$, or $\$ 1,000,005,661$ with probability 0.99 .
- For such small changes, the company's utility of money is linear, i.e., the company makes decisions using the EMV.
$\bullet$ EMV $=5,661 \times 0.99-494,339 \times 10^{-2}=\$ 661$

## The Company's Perspective (3)

- The alternative is for the company to refuse the premium, in which case the EMV is zero.
- The company should agree to insure the house.
- Note: The company's overhead expenses have not been factored in.

## Assessment Using Certainty Equivalents

1. Set $U\left(C_{*}\right)=0$ and $U\left(C^{*}\right)=1$
2. Consider the reference lottery

$$
\mathrm{L}_{1}\left(\mathrm{C}^{*}, \mathrm{C}_{*} ; 0.5,0.5\right)
$$

- Its certainty equivalent is derived by solving

$$
\mathrm{U}\left(\mathrm{CE}_{1}\right)=0.5 \mathrm{U}\left(\mathrm{C}^{*}\right)+0.5 \mathrm{U}\left(\mathrm{C}_{*}\right)=0.5
$$

## Assessment Using Certainty Equivalents (2)

Thus, we have found a third point of the utility function, that with utility 0.5 .
3. Repeat the process with a new reference lottery

$$
\mathbf{L}_{2}\left(\mathbf{C}^{*}, \mathrm{CE}_{1} ; 0.5,0.5\right)
$$

Solve

$$
\mathrm{U}\left(\mathrm{CE}_{2}\right)=0.5 \mathrm{U}\left(\mathrm{C}^{*}\right)+0.5 \mathrm{U}\left(\mathrm{CE}_{1}\right)=0.75
$$

to get a fourth point of the utility function, $\mathrm{CE}_{\mathbf{2}}$.

# Assessment Using Certainty Equivalents (3) 

4. Repeat using $\mathrm{L}_{3}\left(\mathrm{CE}_{1}, \mathrm{C}_{*} ; \mathbf{0 . 5}, 0.5\right) \Rightarrow$

$$
\mathrm{U}\left(\mathrm{CE}_{3}\right)=0.5 \mathrm{U}\left(\mathrm{CE}_{1}\right)+0.5 \mathrm{U}\left(\mathrm{C}_{*}\right)=0.25
$$

to get a fifth point, and so on.
