Kepler Problem Concept Questions

Question1 Which of the following are Kepler's Laws?

- A. Each planet moves in an elliptical orbit, with the sun at the center of the ellipse.
- B. Each planet moves in an elliptical orbit, with the sun at the focus of the ellipse.
- C. A line from the sun to a given planet sweeps out equal areas in equal times.
- D. Planets move equal distances in equal times.
- E. The periods of the planets are proportional to the cube of the semi-major axis lengths of their orbits.
- F. The periods of the planets are proportional to the 3/2 power of the semi-major axis lengths of their orbits.
- 1. A,C,E
- 2. A,C,F
- 3. A,D,E
- 4. A,D,F
- 5. B,C,E
- 6. B,C,F
- 7. B,D,E
- 8. B,D, F
- 9. None of the above

Answer 6.

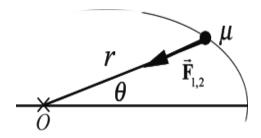

Question 2 The angular momentum about the point *O* of the "reduced body"

- 1.is constant.
- 2.changes throughout the motion because the speed changes.
- 3.changes throughout the motion because the distance from *O* changes.
- 4.changes throughout the motion because the angle θ changes.
- 5. Not enough information to decide.

Answer 1. The only force acting on the reduced body is a central force hence there is no torque about the central point. Therefore the angular momentum about the central point is constant.

Question 3 Suppose the central force is radially symmetric i.e. the force may be a function of distance r from the central point but it is independent of the angle θ . The mechanical energy associated with the motion of the reduced body about the central point is

- 1.is constant.
- 2.changes throughout the motion because the speed changes.
- 3.changes throughout the motion because the distance from *O* changes.
- 4.is not constant because the orbit is not zero hence the central force does work.
- 5. Not enough information to decide.

Answer 1. Because the central force is radially symmetric, it is a conservative force and hence the mechanical energy is constant because there are no non-conservative forces acting on the reduced body.

Question 4: Reduced Mass If $m \equiv m_1 = m_2$, the reduced mass $\mu = \frac{m_1 m_2}{m_1 + m_2}$ is:

- 1. *m*
- 2. 2*m*
- 3. m/2
- 4. None of the above

Answer 3.

$$\mu = \frac{m_1 m_2}{m_1 + m_2} = \frac{m^2}{2m} = m/2.$$

Question 5: Reduced Mass If $m_2 >> m_1$, the reduced mass $\mu = \frac{m_1 m_2}{m_1 + m_2}$ is:

- 1. m_1
- 2. m_2
- 3. $m_2 + m_1$
- 4. $m_2 m_1$
- 5. None of the above

Answer 1.

$$\mu = \frac{m_1 m_2}{m_1 + m_2} \cong \frac{m_1 m_2}{m_2} = m_1 .$$
