## Work and the Dot Product

 Challenge Problems
## Problem 1:

A ball is thrown upward in a strong but steady wind, blowing towards the east. It rises a height $h$, during which time it moves eastward by a distance $l$. Assume that the wind exerts a steady force on the ball of magnitude $F$, toward the east. How much work does the wind do on the ball, from the time it is thrown to when it reaches its maximum height? You can write your answer without explanation.

## Problem 2: Conservation of Energy and Newton's Second Law: Tetherball

A body of mass $m$ whirls around on a string which passes through a fixed ring located at the center of the circular motion. The string is held by a person who pulls the string downward with a constant velocity of magnitude $V$ so that the radial distance to the body decreases from an initial distance $r_{0}$ to a final distance $r_{f}$ from the center. The body has an initial angular velocity $\omega_{0}$. You may neglect the effect of gravity. Show that the work done in pulling the string equals the increase in kinetic energy of the body.
