## Quotes for today

"Any impatient student of mathematics or science or engineering who is irked by having algebraic symbolism thrust upon him should try to get along without it for a week."
-- Eric Temple Bell
"To become aware of the possibility of the search is to be onto something."
-- Walker Percy

## Overview

- Review of how to solve systems of equations
- Solving equations using Gaussian elimination.
- The simplex algorithm
- a clever search technique
- one of the most important developments in optimization in the last 100 years

## Solving for three variables

| $E_{1}$ | $\mathbf{2} \mathbf{x}_{1}+2 \mathbf{x}_{2}+\mathbf{x}_{3}=$ | $\mathbf{9}$ |
| :--- | :---: | :--- |
| $\mathrm{E}_{2}$ | $\mathbf{2} \mathbf{x}_{1}-\mathbf{x}_{2}+2 \mathbf{x}_{3}=$ | $\mathbf{6}$ |
| $\mathrm{E}_{3}$ | $\mathbf{x}_{1}-\mathbf{x}_{2}+2 \mathbf{x}_{3}=$ | $\mathbf{5}$ |

Step 1. Make the coefficients for $\mathrm{x}_{1}$ in the three equations 1,0 and 0 .

| $\mathrm{E}_{4}=.5 \mathrm{E}_{1}$ | $\mathrm{x}_{1}$ | + | $\mathrm{x}_{2}$ | + | $.5 \mathrm{x}_{3}$ | $=$ | $9 / 2$ |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| $\mathrm{E}_{5}=\mathrm{E}_{2}-\mathrm{E}_{1}$ |  | - | $3 \mathrm{x}_{2}$ | + | $\mathrm{x}_{3}$ | $=$ | -3 |
| $\mathrm{E}_{6}=\mathrm{E}_{3}-.5 \mathrm{E}_{1}$ |  | - | $2 \mathrm{x}_{2}$ | + | $1.5 \mathrm{x}_{3}$ | $=$ | $1 / 2$ |

## Steps 2 and 3.

| $\mathrm{E}_{4}$ | $\mathrm{x}_{1}$ | + | $\mathrm{x}_{2}$ | + | $.5 \mathrm{x}_{3}$ | $=$ | $9 / 2$ |
| :---: | ---: | ---: | ---: | ---: | ---: | ---: | :---: |
| $\mathrm{E}_{5}$ |  | - | $3 \mathrm{x}_{2}$ | + | $\mathrm{x}_{3}$ | $=$ | -3 |
| $\mathrm{E}_{6}$ |  | - | $2 \mathrm{x}_{2}$ | + | $1.5 \mathrm{x}_{3}$ | $=$ | $1 / 2$ |

$$
\begin{array}{rlllrl}
\mathrm{E}_{7}=\mathrm{E}_{4}-\mathrm{E}_{8} & \mathrm{x}_{1} & & +5 \mathrm{x}_{3} / 6 & = & 7 / 2 \\
\mathrm{E}_{8}=-\mathrm{E}_{5} / 3 & & \mathrm{x}_{2} & -\mathrm{x}_{3} / 3 & = & 1 \\
\mathrm{E}_{9}=\mathrm{E}_{6}+2 \mathrm{E}_{8} & & & +5 \mathrm{x}_{3} / 6 & = & 5 / 2
\end{array}
$$

| $E_{10}=E_{7}-5 E_{12} / 6$ | $\mathbf{x}_{1}$ |  |  |  |  | $=$ | $\mathbf{1}$ |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| $E_{11}=E_{8}+E_{12} / 3$ |  |  | $\mathbf{x}_{2}$ |  |  | $=$ | $\mathbf{2}$ |
| $E_{12}=6 E_{9} / 5$ |  |  |  |  | $\mathbf{x}_{3}$ | $=$ | 3 |

Variation: write variables at the top, and keep track of changes in coefficients.

| $E_{1}$ | $2 x_{1}+2 x_{2}+x_{3}=9$ |
| :--- | :--- |
| $E_{2}$ | $2 x_{1}-x_{2}+2 x_{3}=6$ |
| $E_{3}$ | $x_{1}-x_{2}+2 x_{3}=5$ |

|  | $x_{1}$ | $x_{2}$ | $x_{3}$ |  | RHS |
| :---: | :---: | :---: | :---: | :---: | :---: |
| $E_{1}$ | 2 | 2 | 1 | $=$ | 9 |
| $E_{2}$ | 2 | -1 | 2 | $=$ | 6 |
| $E_{3}$ | 1 | -1 | 2 | $=$ | 5 |

## Solve equations as before

## Some notation

|  | $x_{1}$ | $x_{2}$ | $x_{3}$ |  | RHS |
| :---: | :---: | :---: | :---: | :---: | :---: |
| $\mathrm{E}_{7}$ | 1 | 0 | $5 / 6$ | $=$ | $7 / 2$ |
| $\mathrm{E}_{8}$ | 0 | 1 | $-1 / 3$ | $=$ | 1 |
| $\mathrm{E}_{9}$ | 0 | 0 | $5 / 6$ | $=$ | $5 / 2$ |

When the equations are written with variables at the top and coefficients are below, it will be called a tableau.

| 1 |  | 0 |  |
| :--- | :--- | :--- | :--- |
| 0 | and | 1 | are unit vectors $1_{1}$ and $1_{2}$. |
| 0 |  | 0 |  |

Q1. Suppose that we finish solving the three equations.
We have just carried out Steps 1 and 2. After we carry out Step 3, which of the following is not true:

|  | $\mathbf{x}_{1}$ | $\mathbf{x}_{2}$ | $\mathbf{x}_{3}$ |  | RHS |
| :---: | :---: | :---: | :---: | :---: | :---: |
| $\mathrm{E}_{7}$ | 1 | 0 | $5 / 6$ | $=$ | $7 / 2$ |
| $\mathrm{E}_{8}$ | 0 | 1 | $-1 / 3$ | $=$ | 1 |
| $\mathrm{E}_{9}$ | 0 | 0 | $5 / 6$ | $=$ | $5 / 2$ |

1. The column for $x_{3}$ becomes $1_{3}$.
2. The columns for $x_{2}$ and $x_{3}$ remain as $1_{1}$ and $1_{2}$.
3. The first equation becomes $x_{1}=7 / 2$.
4. The third equation gives the solution for $\mathrm{x}_{3}$.

## Pivoting

|  | $\mathrm{x}_{1}$ | $\mathrm{x}_{2}$ | $\mathrm{x}_{3}$ | $\mathrm{x}_{4}$ |  | RHS |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Row 1 | 2 | 2 | 1 | 1 | $=$ | 9 |
| Row 2 | 2 | -1 | 2 | 0 | $=$ | 6 |
| Row 3 | 1 | -1 | 2 | 1 | $=$ | 5 |

To pivot on the coefficient in row $i$ and column $j$ is to convert column j into $\mathbf{1}_{\mathrm{i}}$ by

1. multiply row i by a constant
2. add multiples of row ito other rows.

|  | $\mathrm{x}_{1}$ | $\mathrm{x}_{2}$ | $\mathrm{x}_{3}$ | $\mathrm{x}_{4}$ |  | RHS |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Row 1 | 0 | 3 | -1 | 1 | = | 3 |
| Row 2 | 1 | -1/2 | 1 | 0 | = | 3 |
| Row 3 | 0 | -1/2 | 1 | 1 | = | 2 |

Q2. Suppose that we pivot on the "-1" in Row 1. What is coefficient of $x_{4}$ in Row 3 after the pivot?

| $\mathbf{x}_{1}$ |  | $\mathrm{x}_{2}$ | $\mathrm{x}_{3}$ | $\mathrm{X}_{4}$ |  | RHS |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Row 1 | 0 | 3 | -1 | 1 | = | 3 |
| Row 2 | 1 | -1/2 | 1 | 0 | = | 3 |
| Row 3 | 0 | -1/2 | 1 | 1 | = | 2 |

A. 0
B. 1
C. 2
D. There is not enough information

## Summary of solving equations

To solve for $x_{1}, x_{2}$, and $x_{3}$ we

- pivot on row 1, col 1
- pivot on row 2, col 2
- pivot on row 3, col 3
(assuming the coefficients are non-zero)

This concludes are summary of solving equations.

## Linear Programming

- Getting LPs into the correct form for the simplex method
- changing inequalities (other than non-negativity constraints) to equalities
- putting the objective function
- canonical form
- The simplex method, starting from canonical form.

## A linear program with inequality constraints.

Consider a linear program in which all variables are non-negative. How can we convert inequality
constraints into equality constraints?
$\max z=3 x_{1}+2 x_{2}-x_{3}+2 x_{4}$

$$
\begin{gathered}
x_{1}+2 x_{2}+x_{3}-x_{4} \leq 5 ; \\
2 x_{1}+4 x_{2}+x_{3}+3 x_{4} \geq 8 \\
x_{1}, x_{2}, x_{3}, x_{4} \geq 0
\end{gathered}
$$

We convert a " $\leq$ " constraint into a "=" constraint by adding a slack variable, constrained to be $\geq 0$.

$$
\begin{gathered}
x_{1}+2 x_{2}+x_{3}-x_{4}+s_{1}=5 \\
s_{1} \geq 0
\end{gathered}
$$

## Converting a " $\geq$ " constraint.

$$
2 x_{1}+4 x_{2}+x_{3}+3 x_{4} \geq 8 ;
$$

We convert a " $\geq$ " constraint into a "=" constraint by subtracting a surplus variable, constrained to be $\geq 0$.

$$
\begin{gathered}
2 x_{1}+4 x_{2}+x_{3}+3 x_{4}-s_{2}=8 ; \\
s_{2} \geq 0
\end{gathered}
$$

Whenever we transform a new constraint, we create a new variable. There is only one equality constraint for each slack variable and for each surplus variable.

## Creating an LP tableau from an LP

Assumptions:

- All variables are nonnegative
- All other constraints are "=" constraints.
$\max z=3 x_{1}+2 x_{2}-x_{3}+2 x_{4}$

$$
\begin{aligned}
& x_{1}+2 x_{2}+x_{3}-x_{4}+s_{1}=5 ; \\
& 2 x_{1}+4 x_{2}+x_{3}+3 x_{4}-s_{2}=8 ; \\
& x_{1}, x_{2}, x_{3}, x_{4}, s_{1}, s_{2} \geq 0
\end{aligned}
$$

Question: what variables should we include?
what about the objective function?

## An LP tableau

$\max z=3 x_{1}+2 x_{2}-x_{3}+2 x_{4}$

$$
x_{1}+2 x_{2}+x_{3}-x_{4}+s_{1}=5
$$

$$
2 x_{1}+4 x_{2}+x_{3}+3 x_{4} \quad-s_{2}=8
$$

$$
x_{1}, x_{2}, x_{3}, x_{4}, s_{1}, s_{2} \geq 0
$$

$$
-z+3 x_{1}+2 x_{2}-x_{3}+2 x_{4}=0
$$

| $-z$ | $\mathrm{x}_{1}$ | $\mathrm{x}_{2}$ | $\mathrm{x}_{3}$ | $\mathrm{x}_{4}$ | $\mathrm{~s}_{1}$ | $\mathrm{~s}_{2}$ |  | RHS |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| 1 | 3 | 2 | -1 | 2 | 0 | 0 | $=$ | 0 |
| 0 | 1 | 2 | 1 | -1 | 1 | 0 | $=$ | 5 |
| 0 | 2 | 4 | 1 | 3 | 0 | -1 | $=$ | 8 |

## The simplex method begins with an LP in canonical form

| -z | $\mathrm{x}_{1}$ | $\mathrm{x}_{2}$ | $\mathrm{x}_{3}$ | $\mathrm{x}_{4}$ | $\mathrm{s}_{1}$ | $\mathrm{s}_{2}$ |  | RHS |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| 1 | 3 | 2 | -1 | 2 | 0 | 0 | = | 0 |
| 0 | 1 | 2 | 1 | -1 | 1 | 0 | = | 5 |
| 0 | 2 | 4 | 1 | 3 | 0 | -1 | = | 8 |

An LP tableau is in canonical form if all of the following are true.

1. All decision variables are non-negative (except for-
2. All (other) constraints are equality constraints.
3. The RHS is non-negative (except for cost row)
4. For each row $i$, there is a column equal to $1_{i}$.

## An LP in canonical form

| $-z$ | $\mathrm{x}_{1}$ | $\mathrm{x}_{2}$ | $\mathrm{x}_{3}$ | $\mathrm{x}_{4}$ | $\mathrm{x}_{5}$ | $\mathrm{x}_{6}$ |  | RHS |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| 1 | 3 | -2 | -1 | 0 | 1 | 0 | $=$ | 0 |
| 0 | 1 | -2 | 1 | 1 | -1 | 0 | $=$ | 5 |
| 0 | 2 | -4 | -1 | 0 | 2 | 1 | $=$ | 1 |

Our checklist from the previous slide

1. All decision variables are non-negative (except for-
2. All (other) constraints are equality constraints.
3. The RHS is non-negative (except for cost row)
4. For each row $i$, there is a column equal to $1_{i}$.

## On the row with the objective function

| $-z$ | $\mathrm{x}_{1}$ | $\mathrm{x}_{2}$ | $\mathrm{x}_{3}$ | $\mathrm{x}_{4}$ | $\mathrm{x}_{5}$ | $\mathrm{x}_{6}$ |  | RHS |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| 1 | 3 | -2 | -1 | 0 | 1 | 0 | $=$ | 0 |

We will refer to the row with the objective function as the "z-row" It's a term that is used only in 15.053 and 15.058.

Professor Orlin accidentally referred to this row as the "z-row" a decade ago, and found it amusing at that time because it sounds the same as 0 .

He still uses the term.

Q3. Consider the tableau below, where a, b, c, and c are unknown. Under what conditions is the tableau in canonical form? Select the best answer.

| $\mathbf{- z}$ | $\mathbf{x}_{\mathbf{1}}$ | $\mathbf{x}_{2}$ | $\mathbf{x}_{3}$ | $\mathbf{x}_{\mathbf{4}}$ | $\mathbf{x}_{5}$ | $\mathbf{x}_{\mathbf{6}}$ |  | RHS |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| $\mathbf{1}$ | 3 | -4 | -1 | $\mathbf{0}$ | 1 | $\mathbf{0}$ | $\mathbf{=}$ | $\mathbf{a}$ |
| $\mathbf{0}$ | 1 | -2 | 1 | $\mathbf{1}$ | -1 | $\mathbf{0}$ | $\mathbf{=}$ | $\mathbf{5}$ |
| $\mathbf{0}$ | 2 | -4 | -1 | $\mathbf{b}$ | 2 | $\mathbf{1}$ | $\mathbf{=}$ | $\mathbf{C}$ |

1. $a \geq 0$
$b=0$,
2. $\begin{aligned} a & \leq 0 \\ b & =0,\end{aligned}$
3. $b=0$,
4. $b=0$,
$c \geq 0$.
$c>0$
$c \geq 0$.
$c>0$.
5. All decision variables are non-negative (except for-z)
6. All (other) constraints are equality constraints.
7. The RHS is non-negative (except for cost row)
8. For each row $i$, there is a column equal to $1_{i}$.

The simplex method will start with a tableau in canonical form. Is it easy to put a linear program into canonical form?

It's pretty easy to satisfy conditions 1 to 3. It's called putting an LP into standard form. Condition 4 is tricky. We'll explain how to do it next lecture. For now, I ask you and the students to accept that we start in canonical form.

OK. For now.

## Mental Break

$$
\begin{aligned}
& T F \\
& T T
\end{aligned}
$$

## Basic variables, non-basic variables, and basic feasible solutions.

| $-z$ | $\mathrm{x}_{1}$ | $\mathrm{x}_{2}$ | $\mathrm{x}_{3}$ | $\mathrm{x}_{4}$ | $\mathrm{x}_{5}$ | $\mathrm{x}_{6}$ |  | RHS |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| 1 | 3 | -2 | -1 | 0 | 1 | 0 | $=$ | 0 |
| 0 | 1 | -2 | 1 | 1 | -1 | 0 | $=$ | 5 |
| 0 | 2 | -4 | -1 | 0 | 2 | 1 | $=$ | 1 |

The basic variables are the variables corresponding to the identity matrix. $\left\{-z, x_{4}, x_{6}\right\}$.

The nonbasic variables are the remaining variables. $\left\{x_{1}, x_{2}, x_{3}, x_{5}\right\}$

The basic feasible solution is the unique solution obtained by setting the non-basic variables to 0 .

$$
z=0, \quad x_{1}=0, \quad x_{2}=0, \quad x_{3}=0, \quad x_{4}=5, \quad x_{5}=0, \quad x_{6}=1
$$

Same problem, different basic variables.

| $-z$ | $x_{1}$ | $x_{2}$ | $x_{3}$ | $x_{4}$ | $x_{5}$ | $x_{6}$ |  | RHS |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| 1 | 3 | -2 | -1 | 0 | 1 | 0 | $=$ | 0 |
| 0 | 1 | -2 | 1 | 1 | -1 | 0 | $=$ | 5 |
| 0 | 2 | -4 | -1 | 0 | 2 | 1 | $=$ | 1 |

| $-z$ | $\mathrm{x}_{1}$ | $\mathrm{x}_{2}$ | $\mathrm{x}_{3}$ | $\mathrm{x}_{4}$ | $\mathrm{x}_{5}$ | $\mathrm{x}_{6}$ |  | RHS |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| 1 | 4 | -4 | 0 | 1 | 0 | 0 | $=$ | 5 |
| 0 | 1 | -2 | 1 | 1 | -1 | 0 | $=$ | 5 |
| 0 | 3 | -6 | 0 | 1 | 1 | 1 | $=$ | 6 |

What are the basic variables?
What are the nonbasic variables?
What is the basic feasible solution?
$z=-5, \quad x_{1}=0, \quad x_{2}=0, \quad x_{3}=5, \quad x_{4}=0, \quad x_{5}=0, \quad x_{6}=6$.

A basic feasible solution is a corner point solution.

## A warm exercise about optimality conditions.

Q4. What is the optimal objective value for the following linear program.
maximize $z=-3 x_{1}-4 x_{2}-0 x_{3}+13$
subject to $\quad x_{1}, x_{2}, x_{3} \geq 0$
A. 0
B. 13
C. 20
D. There is not enough information

## Optimality conditions for a maximization problem

Optimality Condition. A basic feasible solution is optimal if every coefficient in the $z$-row is non-positive.

| Basic Var | $-z$ | $x_{1}$ | $x_{2}$ | $x_{3}$ | $x_{4}$ | $x_{5}$ |  | RHS |
| :--- | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| $-z$ | 1 | 0 | -13 | 0 | 0 | -1 | $=$ | -17 |
| $x_{3}$ | 0 | 0 | 2 | 1 | 0 | 2 | $=$ | 4 |
| $x_{4}$ | 0 | 0 | -1 | 0 | 1 | -2 | $=$ | 1 |
| $x_{1}$ | 0 | 1 | 6 | 0 | 0 | 1 | $=$ | 3 |

BFS

| z | $\mathrm{x}_{1}$ | $\mathrm{x}_{2}$ | $\mathrm{x}_{3}$ | $\mathrm{x}_{4}$ | $\mathrm{x}_{5}$ |
| :---: | :---: | :---: | :---: | :---: | :---: |
| 17 | 3 | 0 | 4 | 1 | 0 |

Objective: $\quad z=0 x_{1}-13 x_{2}+0 x_{3}+0 x_{4}-x_{5}+17$.
There can be no solution with $\mathrm{x} \geq 0$ that has value $>17$

## Some LP notation

| $\mathbf{- z}$ | $\mathbf{x}_{\mathbf{1}}$ | $\mathbf{x}_{\mathbf{2}}$ |  | $\mathbf{x}_{\mathbf{6}}$ |  | RHS |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| $\mathbf{1}$ | $\mathbf{c}_{\mathbf{1}}$ | $\mathbf{c}_{\mathbf{2}}$ | $\ldots$ | $\mathbf{c}_{\mathrm{n}}$ | $=$ | $\mathbf{- z}_{\mathbf{0}}$ |
| $\mathbf{0}$ | $\mathrm{a}_{11}$ | $\mathrm{a}_{12}$ | $\ldots$ | $\mathrm{a}_{1 \mathrm{n}}$ | $=$ | $\mathrm{b}_{1}$ |
| $\ldots$ | $\ldots$ | $\ldots$ | $\ldots \ldots$ |  |  |  |
| 0 | $\mathrm{a}_{\mathrm{m} 1}$ | $\mathrm{a}_{\mathrm{m} 2}$ | $\ldots$ | $\mathrm{a}_{\mathrm{mn}}$ | $=$ | $\mathrm{b}_{\mathrm{m}}$ |

$c_{i}$ is the cost coefficient for variable $\mathrm{x}_{\mathrm{i}}$.

The initial tableau for an LP

| $\mathbf{- z}$ | $\mathbf{x}_{1}$ | $\mathbf{x}_{2}$ |  | $\mathbf{x}_{6}$ |  | $\mathbf{R H S}$ |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| $\mathbf{1}$ | $\overline{\mathbf{c}}_{1}$ | $\overline{\mathbf{c}}_{2}$ | $\ldots$ | $\overline{\mathbf{c}}_{\mathrm{n}}$ | $\mathbf{=}$ | $\overline{\mathbf{z}}_{0}$ |
| 0 | $\overline{\mathrm{a}}_{11}$ | $\overline{\mathrm{a}}_{12}$ | $\ldots$ | $\overline{\mathrm{a}}_{1 n}$ | $=$ | $\overline{\mathrm{b}}_{1}$ |
| $\ldots$ | $\ldots$ | $\ldots$ | $\ldots \ldots$ |  |  |  |
| 0 | $\overline{\mathrm{a}}_{\mathrm{m} 1}$ | $\overline{\mathrm{a}}_{\mathrm{m} 2}$ | $\ldots$ | $\overline{\mathrm{a}}_{\mathrm{mn}}$ | $=$ | $\overline{\mathrm{b}}_{\mathrm{m}}$ |

$\overline{\mathbf{c}}_{\mathrm{i}}$ is the reduced cost for variable $\mathrm{x}_{\mathrm{i}}$.

The tableau for the same LP after pivoting

## Optimality conditions for a maximization problem

Optimality Condition. A basic feasible solution is optimal if the reduced cost of every variable (except $z$ ) is non-positive.

| Basic Var | $-z$ | $x_{1}$ | $x_{2}$ | $x_{3}$ | $x_{4}$ | $x_{5}$ |  | RHS |
| :--- | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| $-z$ | 1 | 0 | -13 | 0 | 0 | -1 | $=$ | -17 |
| $x_{3}$ | 0 | 0 | 2 | 1 | 0 | 2 | $=$ | 4 |
| $\mathrm{x}_{4}$ | 0 | 0 | -1 | 0 | 1 | -2 | $=$ | 1 |
| $\mathrm{x}_{1}$ | 0 | 1 | 6 | 0 | 0 | 1 | $=$ | 3 |

How to obtain a better solution if the bfs is not optimal.

| $-z$ | $x_{1}$ | $x_{2}$ | $x_{3}$ | $x_{4}$ | $x_{5}$ | $x_{6}$ |  | RHS |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| 1 | 4 | -4 | 0 | -1 | 0 | 0 | $=$ | -3 |
| 0 | 1 | -2 | 1 | 1 | -1 | 0 | $=$ | 5 |
| 0 | 3 | -6 | 0 | 1 | 1 | 1 | $=$ | 6 |

$z=4 x_{1}-4 x_{2}-x_{4}+3$
Choose $i$ so that $\bar{c}_{i}>0$. (choose $\left.i=1\right)$

- Note: $\mathbf{x}_{\mathrm{i}}$ is a nonbasic variable

Increase $\mathrm{x}_{1}$.
Avoid increasing $\mathrm{x}_{2}, \mathrm{x}_{4}, \mathrm{x}_{5}$. (Do not change the value of any of the other nonbasic variables).

## Finding a solution with higher profit.

| $-z$ | $\mathrm{x}_{1}$ | $\mathrm{x}_{2}$ | $\mathrm{x}_{3}$ | $\mathrm{x}_{4}$ | $\mathrm{x}_{5}$ | $\mathrm{x}_{6}$ |  | RUS |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| 1 | 4 | -4 | 0 | -1 | 0 | 0 | $=$ | -3 |
| 0 | 1 | -2 | 1 | 1 | -1 | 0 | $=$ | 5 |
| 0 | 3 | -6 | 0 | 1 | 1 | 1 | $=$ | 6 |

$$
z=4 x_{1}-4 x_{2}-x_{4}+3
$$

Increase $\mathbf{x}_{1}$. ( $x_{1}$ is called the entering variable.) Keep other non-basic variables at 0 ( $x_{2}$ and $x_{4}$ and $x_{5}$ ). Adjust the basic variables $x_{3}$ and $x_{6}$ to maintain feasibility.

$$
\begin{aligned}
-z+4 x_{1} & =-3 \\
x_{1}+x_{3} & =5 \\
3 x_{1}+x_{6} & =6
\end{aligned}
$$

$$
\begin{aligned}
& z=3+4 x_{1} \\
& x_{3}=5-x_{1} \\
& x_{6}=6-3 x_{1}
\end{aligned}
$$

## Moving along an edge: The $\Delta$-Method

$$
\begin{aligned}
& z=3+4 x_{1} \\
& x_{3}=5-x_{1} \\
& x_{6}=6-3 x_{1}
\end{aligned}
$$

$$
\begin{aligned}
& x_{1}=\Delta \\
& z=3+4 \Delta \\
& x_{3}=5-\Delta \\
& x_{6}=6-3 \Delta \\
& x_{2}=x_{4}=x_{5}=0
\end{aligned}
$$

> To express the edge, write all variables in terms of a single parameter $\Delta$.

The edge consists of all vectors $x, z$ that can be formed on the left for $0 \leq \Delta \leq 2$.

Why are the bounds 0 and 2?

## Next steps

- How to recognize unboundedness
- A shortcut that permits one to pivot to the next basic feasible solution (corner point solution)
- But first, a quick review

| $-z$ | $\mathrm{x}_{1}$ | $\mathrm{x}_{2}$ | $\mathrm{x}_{3}$ | $\mathrm{x}_{4}$ | $\mathrm{x}_{5}$ |  | RHS |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| 1 | 0 | -2 | 0 | 0 | +1 | $=$ | -6 |
| 0 | 0 | 2 | 1 | 0 | 2 | $=$ | 4 |
| 0 | 0 | -1 | 0 | 1 | -2 | $=$ | 2 |
| 0 | 1 | 6 | 0 | 0 | 1 | $=$ | 3 |

What is the basic feasible solution?

What is the edge that corresponds to increasing the entering variable?

What is the next basic feasible solution? What is the exiting variable?

## Unboundedness

Theorem. If the column coefficients (except for the zrow) of the entering variable are non-positive, then the objective value is unbounded from above.

| $\mathbf{- z}$ | $\mathbf{x}_{\mathbf{1}}$ | $\mathbf{x}_{\mathbf{2}}$ | $\mathbf{x}_{\mathbf{3}}$ | $\mathrm{x}_{4}$ | $\mathrm{x}_{5}$ | $\mathbf{x}_{\mathbf{6}}$ |  | RUS |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| $\mathbf{1}$ | 4 | $\mathbf{2}$ | $\mathbf{0}$ | 1 | 0 | $\mathbf{0}$ | $\mathbf{=}$ | $\mathbf{5}$ |
| $\mathbf{0}$ | 1 | $\mathbf{- 1}$ | $\mathbf{1}$ | 1 | -1 | $\mathbf{0}$ | $\mathbf{=}$ | $\mathbf{5}$ |
| $\mathbf{0}$ | 3 | $\mathbf{0}$ | $\mathbf{0}$ | 1 | 1 | $\mathbf{1}$ | $\mathbf{=}$ | $\mathbf{6}$ |

Suppose that $x_{2}$ enters.
Let $x_{2}=\Delta$.

$$
x_{1}=x_{4}=x_{5}=0 \quad\left[\begin{array}{l}
x_{3}-\Delta \\
x_{6}=6
\end{array}\right.
$$

$$
\begin{aligned}
z & =2 \Delta-5 \\
x_{3} & =\Delta+5 \\
x_{6} & =6
\end{aligned}
$$

As $\Delta$ increases, $z$ increases.

There is no upper bound on $\Delta$.

## The Min Ratio Rule

$$
\begin{aligned}
x_{1}=3-\Delta ; & x_{4}=2+2 \\
x_{2}= & 0 ; \\
x_{3}= & \Delta-2 \Delta ; \quad x_{5}=\Delta ; \\
& 0 \leq \Delta \leq \mathbf{z}^{z}=6+\Delta ;
\end{aligned}
$$

$\Delta_{\text {max }}=\min \quad$ RHS coef col. coed
s.t. col. coef >0

The exiting variable is the basic variable in the row with the min ratio.

The simplex pivot rule: pivot on the column of the entering variable and the row which gave the min ratio.

| $-z$ | $\mathrm{x}_{1}$ | $\mathrm{x}_{2}$ | $\mathrm{x}_{3}$ | $\mathrm{x}_{4}$ | $\mathrm{x}_{5}$ |  | RHS |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| 1 | 0 | -2 | 0 | 0 | +1 | $=$ | -6 |
| 0 | 0 | 2 | 1 | 0 | 2 | $=$ | 4 |
| 0 | 0 | -1 | 0 | 1 | -2 | $=$ | 2 |
| 0 | 1 | 6 | 0 | 0 | 1 | $=$ | 3 |

| $-z$ | $x_{1}$ | $x_{2}$ | $x_{3}$ | $x_{4}$ | $x_{5}$ |  | RHS |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| 1 | 0 | -3 | -0.5 | 0 | 0 | $=$ | -8 |
| 0 | 0 | 1 | 0.5 | 0 | 1 | $=$ | 2 |
| 0 | 0 | 1 | 1 | 1 | 0 | $=$ | 6 |
| 0 | 1 | 5 | -0.5 | 0 | 0 | $=$ | 1 |

The entering variable is $\mathrm{x}_{2}$. What is the leaving variable?

| $-z$ | $x_{1}$ | $x_{2}$ | $x_{3}$ | $x_{4}$ | $x_{5}$ |  | RHS |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| 1 | 0 | +2 | 0 | 0 | -1 | $=$ | -2 |
| 0 | 0 | 2 | 1 | 0 | 2 | $=$ | 4 |
| 0 | 0 | -1 | 0 | 1 | -2 | $=$ | 1 |
| 0 | 1 | 6 | 0 | 0 | 1 | $=$ | 3 |

1. $x_{1}$
2. $x_{3}$
3. $\mathrm{X}_{4}$
4. -z

## Summary for maximization.

1. Find a variable $\mathbf{x}_{\mathbf{s}}$ so that its cost coefficient is positive.
2. Let $\mathrm{X}_{\mathrm{s}}=\Delta$.
3. Adjust the basic variables as a function of $\Delta$. Choose $\Delta$ maximal.
4. Arrive at a new corner point or else increase $\Delta$ infinitely and prove that the max objective value is unbounded from above.

## Next Lecture

- Review the simplex method
- Show how to obtain an initial bfs
- Prove finiteness (under some assumptions)
